

One Piece Library Website

Project Type

Arabic RTL static web project.

Overview and Objective

The site presents the products and services of One Piece Library, including school supplies, printing, event preparation, gifts, and mobile accessories.

Technologies

HTML5, CSS3, and local image assets.

Main Features

The page contains sections for the library overview, products, services, product details, and a public-contact placeholder. The interface was reorganized visually with responsive RTL styling, cards, improved navigation states, and mobile adjustments.

Database

SQL scripts exist under `binyan.sql/` , but the current HTML has no backend or database connection. The project is therefore static in its current state.

How to Run

Open `nootbook.html` in a browser or serve the folder with a static web server.

Status

Front-end/static project prepared for review. It is not a database-connected application and is not claimed to be full-stack.

Remaining Work

Add approved public contact details and confirm image/content rights before any public publication. A backend connection would require a separate implementation decision.
